- 4.0 UK Patent GB2484274. Patent filed; “*A Fan Assembly – Fan oscillation mechanism*” an invention relates to a fan assembly having an oscillation mechanism for oscillating an air outlet of the fan assembly.

Patent abstract:

A fan assembly for creating an air current includes a body having a first section, a second section connected to the first section, and an air inlet; a casing connected to the first section of the body, the casing comprising an air outlet; a motor-driven impeller for creating an air flow between the air inlet and the air outlet; and an oscillation mechanism for oscillating the first section of the body relative to the second section of the body. To minimize the noise associated with the operation of the oscillation mechanism, the oscillation mechanism includes a bi-directional motor located within the second section of the body, a friction drive member connected to the motor and a driven member connected to the first section of the body and which is driven by the drive member by means of friction there between.
